

New products from sugar beet pulp

Crop

Croppart

Application area

Status

Relevant plant compounds

Sugar Beet

Beta vulgaris subsp. vulgaris cultivar Altissima

Roots / Tubers

Materials	
Fine chemicals	

Research stage

fibres	
pigments	
Cellolose	
Sugars	
Aromats	
organic acids	S

Description

By using multiple extraction techniques, PULP2VALUE will extend the high value products extracted from sugar beet sidestreams, isolating microcellulose fibres (MCF), arabinose (Ara) and galacturonic acid (GalA).

The project will demonstrate an integrated and cost-effective cascading bio-refinery system to refine sugar beet pulp and identify applications for approximately 65% of its mass in high value markets, increasing its current value by as much as 20-50 times.

Pros and cons

- Upgrading the value of a very important residual stream in Europe
- create awareness about the opportunities of biobased materials
- New product on a very competing market
- Challenges in upscaling the product

Used conversion methods

Mechanical-Physical processes

Extraction

Fiber separation

Chemical processes

Oxidation
